                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                 Claim 1, Page 758-759; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA, which comprises one of the 7817 "63" sequences of given in T19001-T25837 and which is able to hybridise to part of caylen in T19001-T25837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed CDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end than a sole primer is unique to a particular mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs. In the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 103 BP; 22 A; 27 C; 21 G; 31 T;

A single-stranded DNA, which complementary strand or the corresp.

C abling in 19901-72683 and which comprises one of the 7837 "GS" sequences glove in 19001-72683 and which comprises one of the 7837 "GS" sequences glove in 19001-72683 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNA hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (asp. using primers and probes derived from the GS crossonising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences (complementary strand or the corresp. given in T1901-T26837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-ent of mRNA by using poly(T) as the sole primer. Since the 3'-ent of mRNA by using poly(T) as the sole primer, since the 3'-ent of mRNA in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 21 C; 25 G; 23 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17569 TGAAATAGAGTCTCGCTCTGTCACCCAGGCTGGAGTGCAGTGGCGCAATCTCAGCTCACT 17628

New isolated nucleic acid segments from the human genome - used for determining polymorphic forms for use in e.g. forensics, paternity resting or phenotypic typing for disease

Claim 1; Page 218; 310pp; English.

Claim 1; Page 218; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammagolobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary capteroxis, von Willebrand's disease, tuberous sclerosis, phere-Danies are propertied interinitent porphyria, appearance (e.g. baldness, obesity), strength, speed, autolimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid areas manner or expensively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4856 TGTGGCTCACACCTGTAATCCCAGCACTTTGGGAGGCTGAGGCGGGCAGATCATCTGAGG 4915

PT determining polymorphic forms for use in e.g. forensics, paternity PT determining polymorphic typing for disease
Claim 1; Page 219; 310pp; English.

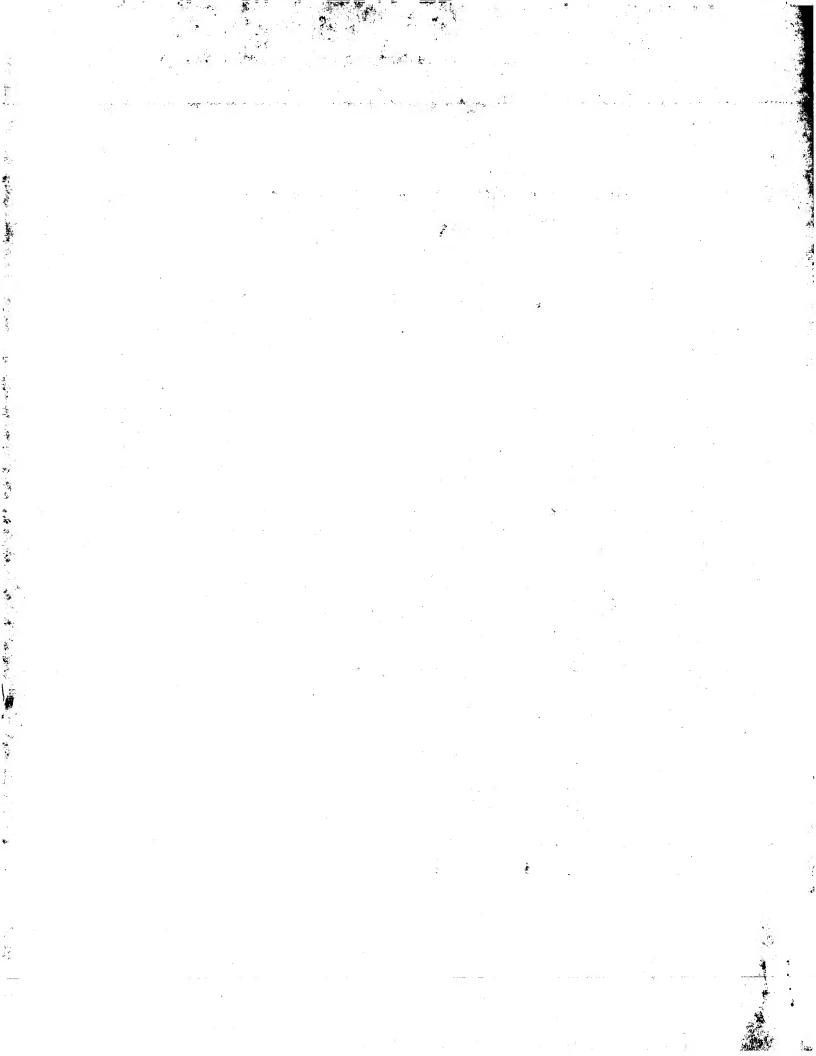

X10269-X12937 are human DNA fragments which contain biallelic polymorphic X10269-X12937 are human DNA fragments which contain biallelic polymorphic of an arkers which have been isolated using the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes instpidus, Lesch-Nyhan syndrome, c.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes instpidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous solerosis, hereditary spherocytosis, now Willebrand's diseases, tuberous solerosis, papearand and subsceptibility cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid copposity solenoes also be used to produce medicaments for the treatment or prophylaxis of such diseases.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUMMARIES

/note="vector: pAMPI0; Site_1: Not1; Site_2: EcoRI; 1st
strand cDNA was primed with oligo(dT)17 on 50 ng of
bDNAse-treated, total cellular RNA obtained from
5,000-10,000 microdissected, histologically normal
prostate epithelial cells. Double-stranded cDNA was
ligated to EcoRI adaptors, 5 cycles of PCR applied to the
cDNA with an adaptor-specific primer, and the resulting
PCR product subcloned into pAMPI0 by the UDC-cloning
method (Life Technologies). Average insert size is 600
bp. NOTE: Not directionally cloned. This library was
constructed by David Krizman."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   62 TGACCTTGTGATCCACCAGCCTCGGCCTCCCAAAGTGCTGGGAT 105
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 65, Application US/08787739
Patent No. 6027887
GENERAL INFORMATION:
APPLICANT: Pastorekova, Silvia
APPLICANT: Pastorekova, Silvia
APPLICANT: Pastorek, Jarcmir
TITLE OF INVENTION: MN Gene and Protein
WIMMER OF SEQUENCES: 96
CORRESPONDENCE ADDRESS:
ADDRESSEE: Leona L. Lauder
STREET: 369 Pine Street, Suite 610
CITY: San Francisco
CITY: San Francisco
CITY: Collifornia
                                                                                                                                                                                                                                                                                                                                                                                                                                           D-0021.3D
                                                                                                                                                                                                                                                                                                                                                                                           NAME: Lauder, Leona L.
REGISTRATION UNUBER: 30,863
REFERENCE/DOCKET NUMBER: D-00
TELECOMMUNICATION INFORMATION:
TELEPHONE: 415-435-0727
INPORMATION FOR SEQ ID NO: 65:
SEQUENCE CHARACTERISTICS:
LENGTH: 105 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: DNA (genomic)
HYPOTHETICAL: NO

Sequence 91, Application US/08450673C
Patent No. 594888
GENERAL INFORMATION:
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: Allzheimer's Disease

Patent No. 5830670
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                QY 24962 CACGCCTATAATCCCAGCTCTTTGGGAGGCCTAGGCGGGTGGATCACGAGGTCAGGAGTT 25021

See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
all-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.
Data kindly reviewed (07-DEC-1987) by HUMPHRIES S.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryotta: Metazoa; Chordata; Vertebrata; Mammalla; Eutherla; Primates; Catarrhini; Hominidae; Homo.

```

```
See X05250 for corresponding normal gene sequence
See X05250 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion courred between two
alu-repetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
of the resulting spliced mRNA.

The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-entranslated sequence is unique to a particular mRNAs instead from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. 22 C; 25 G; 22 T;

markers which have been isolated using the primers represented in markers which have been isolated using the primers represented in the markers which have been isolated using the primers represented in the 209121-340268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in a sagammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy. Wiskott-Addrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary hemorrhagic telangiectasia, familial colonic polyposis, Bhiers-Danios syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous such autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, and only pathogenic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human gene claim 37; Page 18; 60pp; English.

Claim 37; Page 18; 60pp; English.

Sequences shown in V4120 to V4124/ represent nucleotide sequences of sequences shown in V4120 to V4124/ represent nucleotide sequences of mouse EST from tagged cDNA clones. These are used in the method of the invention of screening for human developmental genes. The method comparises inserting a promoterless reporter gene into a non-primate mammalian embryonic stem cell (ESC) genome and identifying cellular transcripts that encode the reporter gene product. Fragments of genes encoding these transcripts are cloned and sequenced. A gene encoding the transcript, or part of it, in different evel of the gene encoding the transcript, or part of it, in different cell types and/or different developmental stages is detected. A gene showing different are encoding its selected and expression levels of a homologous non-human primate gene, in different cell types and/or at differential expression is selected and the non-primate transcript as probe is detected. A homologous gene having the same pattern of differential expression is selected and the non-primate gene, or part of it is used to identify the homologous human gene. The ESC transcripts identified by this method are used to generate transgenic animals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1;

selected from rats, hamsters, rabbits, dogs, pigs, horses, cows, monkey, babbon or chimpanzee for study of gene function. The method provides rapid and large scale screening for human developmental genes, and eliminates the need to analyse reporter gene expression in embryos. Sequence 86 BP; 16 A; 28 C; 30 G; 12 T;

The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented conna hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.

Claim 1; Page 758-759; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

C double-stranded DNA) which comprises one of the 7837 "GS sequences

given in T19001-T26837 and which is able to hybridise to part of

thuman genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)

Sequences were obtained from 3'-directed cDNA libraries prepared

from various human tissues; synthesis of cDNA was initiated from the

curranslated sequence is unique to a particular mRNA species, almost

all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library

c is constructed so as to reflect accurately the relative abundance of

different mRNAs in the particular tissue from which it was derived.

C The appearance frequency of a given GS in a cDNA library can be

c determined (esp. using primers and probes derived from the GS.

Sequences) as a means of diagnosing abnormal cell function or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       10793 GATTCTACTGCCTCGCCCTCCCGAGTAGCTGGGACCACAGATACGTGCCCACCATGCCCCG 10852

The restriction of properties of the contain belong the containing polymorphic forms for use in e.g. forensics, paternity by testing or phenotypic typing for disease

Claim 1: Page 219; 310pp; English.

CX 10269-XI2937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-XI0268 The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, c.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Pabry's disease, hereditary spherocytosis, von Willebrand's disease, thereditary captemorthagic telangiectasia, familial colonic polyposis, Ehlers-Danlos Syndrome, osteogenesis imperfected, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics can slongevity, appearance (e.g. baldness, obseity), strength, speed, candurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid connowlaxis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    7108 TTAATCCCGGCAATTTGGGAGGCCGAGGCGGGCGGATCACTTGAGGTCGGGAGTTCGAGA 7167
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T1901-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from warious human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs species, almost different mRNAs is a couracted to a constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    e.g.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A single-stranded DNA (or its complementary strand or the corresp. a single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS sequences of given in T19001-T25687 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end ranslated sequence is unique to a particular mRNA species, almost is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 93 BP; 25 A; 27 C; 24 G; 17 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         13277 TTTGAGATGGAATTTCACTCTTGTTGTTGTCAGGCTGGGGTGCAGTGGCACAGTCTCAGCTC 13336

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               double-stranded DNA for its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of pure of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 108 BP; 34 A; 31 C; 26 G; 15 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9486 ATGCCGTGAACGCGGGAGCGTGCAGTGAGCCGAGATCGCGCCACGGCACTCCAG 9545

autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments an also be used to produce medicaments for the treatment or prophylaxis of such diseases. 25 C; 22 G; 30 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12008 GATCCACCGCCTCGGCCTCCCAAAGTGCTGGGATTACAGGTATGAGCCACTGGGCCCGG 12067

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA libraries prepared from various human tissues; synthesis of cDNA intrace from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.

The standard with the segments and the standard sender of the standard segments are standard segments. The standard segments are claim 1; page 219; 310pp; English.

X10269-XX2937 are human DNA fragments which contain biallelic polymorphic testing or phenotypic typing for disease coupying the primers represented in X09121-XX10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic forms in an individual for use in methods for determining polymorphic syndrome, reachers in polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, hereditary cancer, observing, appearance (e.g. familial colonic polyposis, Bhiers Danios syndrome, osteogenesis inperfected, acute intermittent porphyria, autofimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic or determine of each of such a produce medicaments for the treatment or proposition of such an entermine of the content of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     8434 TGCAGCTCACGCCTGTAATACCAGCATTTTGGGAGGCCAAGGTGGGAGGATCACTTGAGC 8493

double-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences
given in 19001-172837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
sequences were obtained from 3'-directed cDNA libraries prepared
from various human tissues; synthesis of cDNA was initiated from the
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
untranslated sequence is unique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for
sequence 110 BP; 34 A; 27 C; 23 G; 20 T;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUMMARIES
